

Surface construction – replacement Friesli-rainpark 1-7, Sursee

Sursee · 2023

SERVICE AREA

General civil engineering and road construction, pavement construction

PROJECT OVERVIEW

The renovation of Frieslirainpark 1-7 involved peeling off the existing paint surface with broken grains to a depth of minus 3.5 cm. Since this was an inner-city project with numerous residents and access roads, the paving installation stage was divided into three sections after milling. After cleaning and applying the primer, the new AC 8 white-beige color covering was installed in stages – around 80 tonnes per section. The covering was manufactured in Hasle Rüegsau and delivered directly to the construction site. Particular attention was paid to the white coloring, which was not allowed to be contaminated by black traces or the primer during installation.

Main quantities

250 ton AC white-beige «C965.03» General civil engineering and road construction, pavement construction, colored pavement
